Introduction

Hydrock have been commissioned by Wakefield Developments Pembrokeshire Limited to provide a drainage strategy report and preliminary design for the proposed residential development at the land of Maes Ffynonn, Roch, Pembrokeshire.

It is our understanding that the client is seeking to develop the current greenfield site allocated within the LDP into a residential development and that this report is required to support the future planning application and SAB pre-application submissions.

The objectives of the report are to;

- Review the existing drainage arrangements on site for both surface and foul water;
- Assess the feasibility of Sustainable Drainage Systems (SuDS) features within the development to control and discharge surface water runoff to comply with the requirements of the statutory National Standards for Sustainable Drainage Systems;
- Assess the options for the disposal of foul water from the development; and
- Provide a preliminary design for surface water (SuDS) systems including indicative sizing of storage/attenuation features and conceptual plan suitable for inclusion in a pre-application submission to the local authority's SuDS Approval Body (SAB).

The following tasks will be undertaken to complete this report;

- Undertake a desktop investigation of the site's existing foul and surface water drainage arrangements;
- Outline anticipated solutions for foul sewage disposal, surface water disposal. This will include preliminary calculations, in order that the conceptual designs may be agreed with the relevant authorities. In preparing the surface water drainage strategy, we will consider inundation of the floodplain and assess flood levels in the location of attenuation features;
- Determine the area of impermeable surfaces that will be added by the proposed development and estimate the equivalent greenfield and brownfield run-off rates for this area;
- Assess the feasibility of using infiltration as a disposal method, based on soakaway test results or any other available information on ground and site conditions;
- Estimate the size of storm water storage needed to manage run-off from the site post-development, using drainage design software (Infodrainage);
- Provide general information on the maintenance and adoption of SuDS via the SAB's approval process; and
- Give consideration to drainage exceedance. In particular, use topographic information to identify overland flow paths and areas susceptible to surface water ponding.

A number of sources have been used to compile this drainage strategy. Whilst Hydrock believe them to be trustworthy we are unable to guarantee the accuracy of the information that has been provided by others.

This report is based on information available at the time of preparation. Consequently, there is potential for further information to become available. These changes may lead to future alteration to the conclusions drawn in this report for which Hydrock cannot be held responsible.

Existing Site

1. SITE LOCATION

Figure 1 indicates the site location within the red circle, which is located off the A487 via Pilgrim's Way, Roch, Harverfordwest, SA62 6AJ (Approximate Grid Reference X-187447, Y-221279). ©[OpenStreetMap](https://www.openstreetmap.org) contributors.

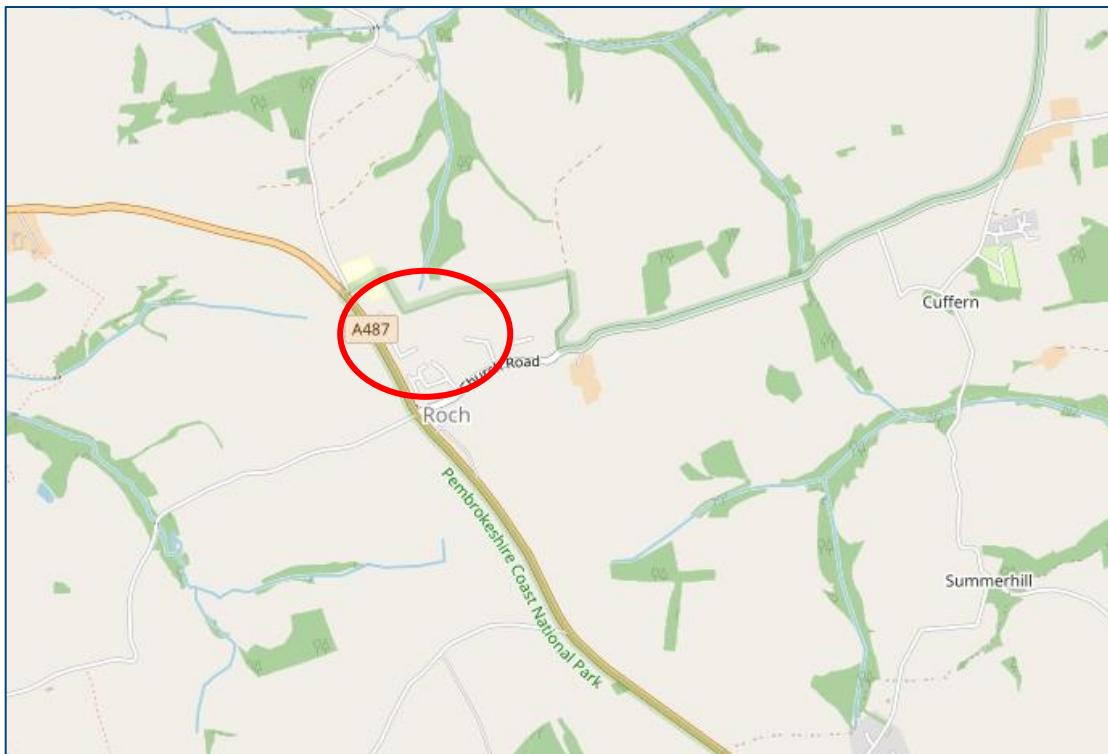

Figure 1 - Site Location Plan

2. SITE DESCRIPTION

The site is approximately 2.0 hectares (ha) of greenfield land which will be split into two catchments of the development. One catchment is 0.6ha in area and located to the east of the site off Pilgrims Way and the other catchment is 1.4ha on the western side of the site off Maes Ffynnon.

The site is bordered by existing dwellings on the eastern, southern and western boundaries, with greenfield land bordering the northern boundary of the site. The site has allowance for two direct vehicle accesses where one phase will be accessed via Pilgrim's Way, and the other phase will be accessed via Maes Ffynnon which are located to the west and east of the site respectively.

A copy of the existing site plan can be found in Appendix C of this report.

3. EXISTING DRAINAGE ARRANGEMENTS

From available mapping information it has been established that the nearest watercourse is located north of the site which flows south to north and lies within the site boundary. Additionally, there is an existing pond,

pumping station and tank located within the eastern portion of the site which discharge into the existing watercourse, these existing drainage elements currently serve a number of dwellings from Maes Ffynnon.

The nearest foul sewers are a public foul sewer 150mm in diameter flowing east to west located west of the site within Pilgrim's Way, and an existing pumping station receiving flows from a number of dwellings from Maes Ffynnon via a public foul sewer 150mm in diameter flowing east to west and located within the eastern portion of the site's boundary. Figure 2 contains an extract of the Dwr Cymru Welsh Water (DCWW) asset plan for the area with the site boundary shown in green.

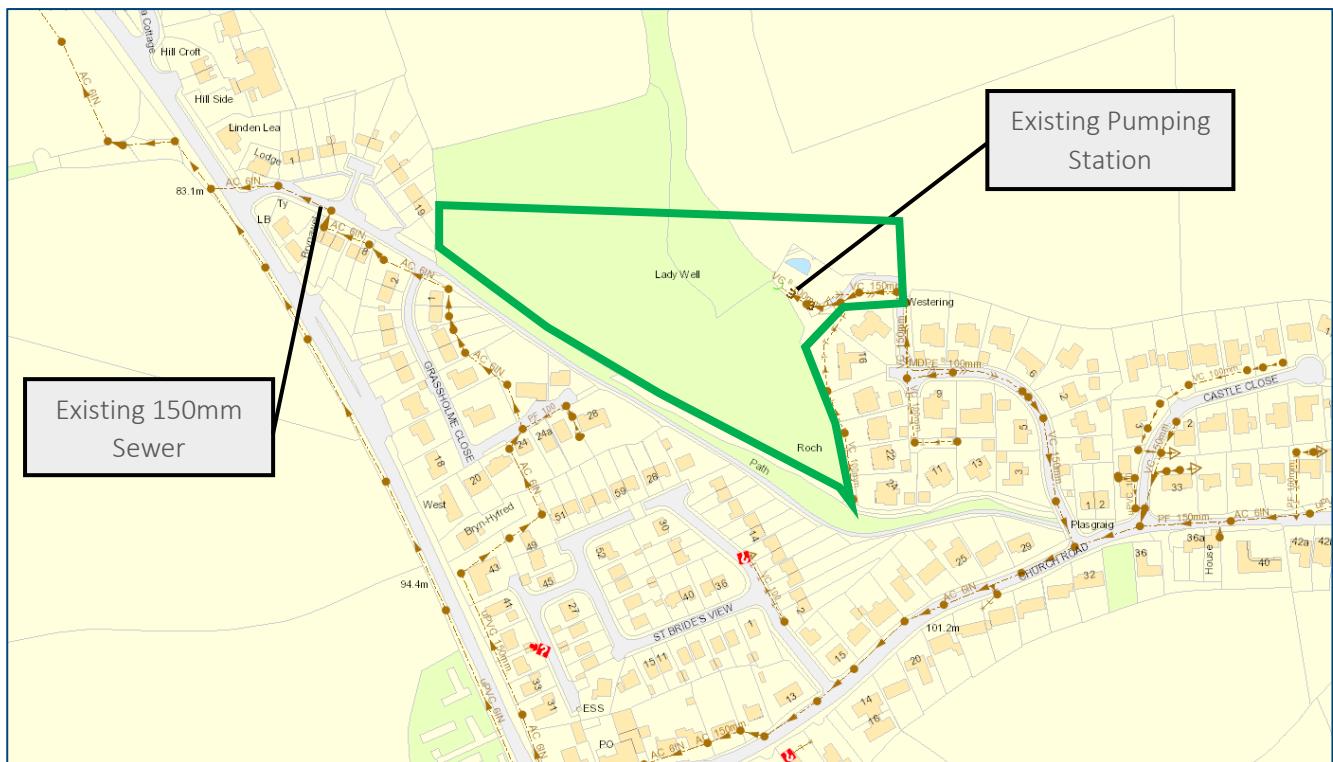

Figure 2- Extract of DCWW Record Plan

4. EXISTING CONTRIBUTING AREAS AND RUN-OFF RATES

The total site area is circa 2.0ha, the global greenfield run-off rates for the western (phase 1) and eastern (phase 2) areas have been calculated using the ICP SuDS method and table 1 summarises the runoff rates for each return period (1, 30 & 100). Calculations detailing the derivation of the values in these tables are available in Appendix A.

Table 1: Greenfield Run-off Rates by Return Period

Return Period	Western (Phase 1) Greenfield Run-off Rate (l/s) (Area 1)	Eastern (Phase 2) Greenfield Run-off Rate (l/s) (Area 2)	Total Site Area Run-off Rate (l/s)
1 YRP	2.9	7.1	10.0
30 YRP	5.9	14.2	20.1
100 YRP	7.3	17.5	24.8

Proposed Development

5. DEVELOPMENT PROPOSALS

For assessment purposes the development is a proposed residential development with associated infrastructure. The proposed new development will be split into two phases which be accessed via Pilgrim's Way and Maes Ffynnon respectively.

6. FOUL DRAINAGE

The proposed new development will be constructed on existing greenfield land with no existing gravity foul drainage outlet. There is an existing public pumping station located near the eastern boundary of the site which serves Maes Ffynnon. It is proposed to discharge the site to the existing public foul sewer west of the site located in Pilgrim's Way. Both phases of the development should be able to gravitate to this new outfall without the need for pumping. The existing foul pumping station located near the eastern boundary of the site that currently serves dwellings from Maes Ffynnon is proposed to be decommissioned and removed with the existing flows being diverted into the new gravity system, this option will need to be discussed further with DCWW at detailed design stage.

The capacity of the existing sewer to receive the flows from the proposed development has been confirmed by DCWW via a pre planning response (PPA0005824), a copy of the pre planning response from DCWW is included in Appendix D.

All on site sewerage systems will be designed and constructed to comply with building regulations requirements with any adopted elements in accordance with the latest edition of "Sewers for Adoption" and any of the adopting authority's (DCWW) specific requirements.

7. SURFACE WATER

The aim of the surface water drainage strategy is to mimic the natural catchment processes as closely as possible and adopt the principles of water management schemes as stated in section 2 of the statutory "Sustainable Drainage Systems Standards for Wales" (SDSSW) document 2018. The previous sections of this report have established the current drainage arrangements on site and have also determined the current discharge rates for surface water leaving the site.

From 7th January 2019 Schedule 3 of the Flood and Water Management Act has been implemented by the Welsh Government which requires any development of more than 1 unit or where the construction area is greater than 100m² to comply with the SuDS Approving Bodies (SAB's) design guidance and ministers' standards which will require all sites to adopt SuDs in their design. The standards are listed below;

- S1 – Surface Water Runoff Destination
- S2 – Surface Water Runoff Hydraulic Control
- S3 – Water Quality
- S4 – Amenity
- S5 – Biodiversity
- S6 – Design of Drainage for Construction, Operation and Maintenance

The Standards listed will need to be met by the design in order to comply with the SDSSW. S1 is a hierarchy standard with standards S2-S6 being fixed.

7.1 S1 – Surface Water Runoff Destination

In determining a suitable methodology for disposal of surface water flows from this development, it is necessary to explore the technical options outlined under Standard S1 of the SDSSW 2018 document published by Welsh Government. This states that disposal should be made through the hierarchical approach which are, in order of preference; surface water runoff collected for use, infiltration methods, discharge to surface water body, discharge to a surface water sewer, highway sewer or another drainage system and finally discharge to a combined sewer. Each of these options are considered below.

7.1.1 *Collected for Use*

The suitability of this option will depend on the proposed water usage of the development, if the development has low grey water demand, as is typical of residential developments the collection of water for reuse would not be economical or feasible, however if the demand for grey water is deemed to be high then rainwater harvesting would be an appropriate solution for parts of the development. The use of rainwater harvesting would need to be used in conjunction with one of the below methods of discharge in order to cater for exceedance flows in extreme rainfall events where the rainfall volume exceeds the volume of surface water storage provided by the rainwater harvesting tanks. As the development is considered to have low demand for grey water the use of a grey water system would not be suitable due to there being periods of very low demand which may result in legionella issues. Basic forms of rainwater harvesting could be incorporated into the development in the form of rainwater butts that will collect water from rainwater downpipes and store it for irrigation of the soft landscaped areas and planting beds however the demand for this will again be low as the planted landscape areas will be accepting surface water runoff from the impermeable areas as part of the design. Based on this storing rain water runoff for reuse is not feasible on this scheme.

7.1.2 *Infiltration Methods*

Based on the site investigation works which were conducted on site on 21.02.2022, where trial holes were dug to a depth of 1m below existing ground level, refer to sketch in Appendix E for locations of trial holes. The results returned no infiltration on the test within Phase 1 and ground water was hit at a depth of approximately 800mm within the trial hole in Phase 2. Based on the findings of the testing we have concluded that soakaways are not feasible means of disposing surface water runoff generated from the site. Photos of the trial holes can be found in Appendix E of this report.

7.1.3 *Discharge to Surface Water Body*

Sequentially, the next consideration in the hierarchical approach is discharge to a surface water body. The nearest watercourse is located within the site boundary to the north of the site, this watercourse currently receives surface water runoff from the dwellings and infrastructure on Maes Ffynnon via an existing pond and tank. The proposed surface water drainage strategy will look to utilise two discharge points into the existing watercourse, one to serve the western portion and one to serve the eastern portion. As part of the proposed design, we would look to decommission the existing attenuation pond and divert the existing surface water flows from Maes Ffynnon into the proposed new system to free up development land within the eastern area of the site.

7.1.4 Discharge to Surface Water Sewer

Based on the above the proposed surface water drainage strategy will not be discharging into a surface water sewer network.

7.1.5 Discharge to Combined Sewer

Based on the above the proposed surface water drainage strategy will not be discharging into a combined sewer network.

7.2 S2 – Surface Water Runoff Hydraulic Control

This standard requires surface water to be managed to prevent as far as possible any discharge from the development for rainfall events of less than 5mm and that the surface water runoff rate and volume for up to a 1 in 100-year return period should be managed to protect people, properties and the receiving water body. Consideration is also required to the risk associated with runoff from events greater than 1 in 100-year return period with mitigating proposals developed for the scheme.

7.2.1 Interception of Runoff

Interception will need to be considered under the statutory standards. Interception aims to mimic greenfield runoff conditions by preventing runoff from the majority of all small rainfall events. This can contribute to reducing pollution load to receiving surface water bodies. Meeting the Interception criterion is not expected during particularly wet periods, when permeable surfaces and subsoils are saturated, so a suggested target is that 80% compliance should be achieved during the summer and 50% in winter. Refer to table G2.1 in the Statutory Standards for Sustainable Drainage Systems 2018 document published by Welsh Government for details of interception mechanisms and their assumed compliance with the standards. It is proposed that this scheme will utilise permeable paving, rain gardens and infiltration/attenuation pond to provide suitable levels of interception.

7.2.2 Hydraulic Control and Storage

For the purposes of this section of the report infiltration will not be accounted for as a means of disposing surface water runoff generated from the development, therefore the discharge volume for the site will not decrease. In order to meet the standards this report has adopted the simple approach outlined in the statutory standards of restricting all runoff from the development site for all return periods up to and including the 1 in 100-year event to the current 1 year return period rates as given in table 1 of this report which equates to a maximum discharge rate of 2.9 l/s and 7.1l/s for area 1 and area 2 of the development respectively.

In accordance with statutory guidelines, the development of this site should not increase flood risk elsewhere and as such, all runoff from attenuated areas on site should be contained within the site boundary for up to and including a 1 in 100 year design period storm, plus 40% climate change and urban creep allowance, these allowances will have to be agreed with the SAB prior to detailed design. It is proposed to discharge surface water runoff from the development via two gravity systems which ultimately discharge to the existing watercourse at separate locations to the north of the site with runoff rates being restricted to 2.9 l/s and 7.1l/s for the western and easter portions of the site which will be referred to as area 1 and area 2 of the development site respectively for this section of the report, this will need to be agreed with the adopting SAB's authority.

Surface water flows from the proposed development would need to be attenuated via two separate flow control chambers, and two separate on-site storage systems provided for surface water runoff for all rainfall events up to and including a 1 in 100 year event with 40% allowance for climate change and urban creep.

Given the proposed site usage overland storage in the form of rain gardens, permeable paving and attenuation basins are achievable in areas across the site. These features will be both on plot and in public open spaces including adjacent the public highways across the site.

For the purposes of this report storage has been estimated using Infodrainage and below provides a summary of the features used and storage values.

For the purposes of this calculation the overall impermeable area for the development has been taken as 1.45ha as shown by the master plan and the maximum discharge rate assumed at 2.9l/s and 7.1l/s for area 1 and area 2 of the site respectively, for all rainfall events up to and including the 100 year return period with 40% allowance for climate change and urban creep, the storage volumes could be reduced by the use of alternative complex controls to satisfy clause G2.30 of the standards, liaison will need to be undertaken with the SAB and DCWW at detailed design stage to confirm the acceptability of the proposed runoff rates and the use of a complex control.

Appendix B contains the Infodrainage calculations for the proposed development and Appendix F contains the proposed layout plans.

Table 2: Development Summary

SuDS Feature	Approx. Area (sqm)		Attenuated Discharge Rate (l/s)		Indicative Storage Provided (m³)	
	Area 1	Area 2	Area 1	Area 2	Area 1	Area 2
Paving Systems	-	328	-	-	-	49.2
Rain Gardens	157.6	203.1	-	-	47.3	60.9
Attenuation Basin	85.5	154	2.9	7.1	105	966
Cellular Storage Tank	164	-	2.9	-	234	-

7.2.3 Allowance of Existing Flows

As part of the proposed design, we would look to decommission the existing attenuation pond and divert the existing surface water flows from Maes Ffynnon into the proposed new system to free up development land within the eastern area of the site. The existing flows from Maes Ffynnon are proposed to be diverted into the proposed new area 2 system with the new northern attenuation basin catering for both the proposed and existing flows. Based on the design information received from the client the design volume of the existing basin is 185cu and the design discharge rate is 8.8 l/s, a copy of the existing design drawings can be found in Appendix F.

The proposed system will make an allowance for the existing flows by increasing the allowable discharge rate from 7.1l/s to 15.9l/s at the outfall to include the design discharge rate of the existing attenuation basin. Along with providing a minimum of 185cu of additional storage to compensate of the removal of the existing attenuation basin. Table 3 below provides a summary of the proposed discharge

rates and the indicative volumes of the proposed attenuation basin allowing for proposed and existing flows. Appendix C contains the Infodrainage calculations for the existing and proposed development.

Table 3: Existing and Proposed Pond Rates & Volumes

	Attenuated Discharge Rate (l/s)	Indicative Storage Provided (m ³)
Proposed Area 2 Only	7.1	781
Existing Basin	8.8	185
Proposed Combined Attenuation Basin	15.9	966

7.2.4 Exceedance Flows and Flood Pathways

"It is inevitable that as a result of extreme rainfall the capacities of sewers, covered watercourses and other drainage systems will be exceeded on occasion. Periods of exceedance occur when the rate of surface runoff exceeds the drainage system inlet capacity, when the pipe system becomes overloaded, or when the outfall becomes restricted due to flood levels in the receiving water. Underground conveyance cannot economically or sustainably be built large enough for the most extreme events and, as a result, there will be occasions when surface water runoff will exceed the design capacity of drains. When drainage exceedance capacity is exceeded the excess water (exceedance flow) is conveyed above ground, and will travel along streets and paths, between and through buildings and across open space. Indiscriminate flooding of property can occur when this flow of water is not controlled." (CIRIA C753).

Flood-flow pathways would be designed to convey the overland flows from rainfall events above a 1in100 year return period to suitable areas of open space, such as landscaped areas, car parking areas and other hard surfaced areas in order to protect properties against flooding. Consideration should also be given to exceedance pathways from storage areas in the event of extreme rainfall or failure with allowance made to convey flows away from properties both on and off the site. These should be considered as part of the detailed drainage and levels design of the development.

7.2.5 Flood Risks to People

"People are at risk of suffering death or serious injury when flooding occurs. People are unable to stand in deep or fast flowing floodwater. Once they are unable to stand, there is a high risk of death or serious injury. Adults are unable to stand in still floodwater with a depth of about 1.5m or greater, although this is obviously affected by the height of a person. The depth of flowing floodwater where people are unable to stand is much less. For example, some people will be at risk when the water depth is only 0.5m, if the velocity is 1m/s (about 2 mph). If the velocity increases to 2m/s (about 4 mph) some people will be unable to stand in a depth of water of only 0.3m. Most people will be unable to stand when the velocity is 2m/s and the depth is 0.6m." (Defra/ Environment Agency, FD2321/TR2)

During the detailed design, a hydraulic model will be built to assist the design of the proposed surface water drainage networks. When an extreme storm event is simulated within the model, potential flooding locations will become evident and the flood flow pathways can be designed/defined based on the proposed layout and levels of the hard areas and landscaping. The depth and velocity of the overland flood water can be determined and then compared with Figure 2.1 (Combinations of flood depth and velocity that cause danger to people) in the Defra / EA Flood Risks to People publication. The velocity and depth as described above would then give a category of flood hazard and the

corresponding risk to people. If the risk is deemed to be too high, then the design would require reassessment.

7.3 S3 – Water Quality

This standard requires treatment of surface water runoff to prevent negative impacts on the receiving water quality and/or protect downstream drainage systems including sewers. The only exception to this standard is where drainage connects directly to a combined sewer, where the quality requirements are limited to preventing the discharge of oil and sediments to the sewer system.

Whilst the development is connecting to the existing watercourse as best practice the aim of the surface water management strategy with regards to water quality is to follow the guiding principles of the SDSSW and use simple, natural processes that promote biodiversity and long-term sustainability. As such, it employs a SuDS management train approach, providing drainage components in series.

The management trains to be used on the project would have been assessed using the Simple Index Assessment (SIA) tool available publicly (<http://www.ukSuDS.com/drainage-calculation-tools/water-quality-assessment-for-SuDS-developments>) which is built around the principles for simple assessment outlined in CIRIA C753 to assess the levels of treatment provided by the proposals.

The possible impact of accidental spills will need to be addressed with the most vulnerable areas to a spill or other pollution incident being any car park areas and access roads, therefore the highway areas and parking will be drained into the permeable paving system or adjacent rain gardens, which will provide a level of treatment for pollution.

Planting within the SuDS features should form part of the water quality strategy. SuDS components like rain gardens provide water quality improvements by reducing sediment and contaminants from runoff either through settlement or biological breakdown of pollutants as part of their interceptor function, so only robust and tolerant species of planting should be specified. Once these species establish this will decrease the flow rate of water travelling through and filter pollutants and contaminants before entering the downstream network.

7.4 S4 – Amenity

This standard requires that the design of the surface water management system should maximise amenity benefits.

The primary amenity focus of the SuDS scheme should be to improve the health and well-being of the users. The scheme will need to be based on natural forms that mimic natural landscapes found within the region and the vegetated rain garden planting areas are designed with locally contextual species that will encourage natural colonisation. Other key amenity benefits should include improving air quality around the development, increasing carbon sequestration and improving water quality through removal of pollutants via rain gardens.

7.5 S5 – Biodiversity

This standard requires that the surface water management system should maximise biodiversity benefits.

The SuDS scheme biodiversity strategy should revolve around the creation of significant and varied habitat to increase the overall biodiversity of the site and ecological value. The inclusion of plant species that will enhance the general eco system and simultaneously act as a water filtration system to clean pollutants and contaminants should be used where possible.

The plant species selected should be both locally contextual and appropriate for the varied habitat zones including primary characteristics that shall ensure:

- Good soil binding and filtration species
- Minimised erosion
- Improved filtration via dense root and stem species
- Tolerance to seasonal variations including droughts and inundations
- Good suspended solids retention
- Pollutant tolerant
- Emergent and pioneering species for natural ecological colonisation
- The creation of diverse, self-sustaining and resilient ecosystems for high species biodiversity
- Support for local and regional habitat strategies

In general, the proposed rain gardens and basin will be the focal habitat for the site and will enhance the site over the current site layout by adding areas of water and damp soils. Exposed areas of rain gardens and ponds will attract certain species and shaded areas under adjacent buildings and trees will further enhance the varied ecosystem potential.

7.6 S6 – Design of Drainage for Construction and Maintenance and Structural Integrity

The surface water drainage system should be designed with the overriding ethos of simplicity in construction, use and maintenance. This then allows a very simple translation from the principles described within standard S6, namely that all elements of the surface water drainage system should be designed so that they can be constructed, as well as maintained and operated "...easily, safely, cost-effectively, in a timely manner, and with the aim of minimising the use of scarce resources and embedded carbon (energy)." (SDSSW).

The proposed system will be offered for adoption as it will serve more than one property, therefore the SAB will be responsible for the maintenance of the off-plot elements of the system to ensure it continues to comply with SuDS standards. In order for the drainage system to be adopted it must be designed and constructed in accordance with the SDSSW document and any conditions of approval stipulated by the SAB.

Information with regards to the construction methodology and requirements of the proposed system will be developed as part of the detailed design stage of the project, likewise the maintenance requirements and regime of the proposed system will be developed into the full maintenance strategy for the site during the next phase of design development. This will be developed in conjunction with the client's maintenance team, as it is not considered appropriate for these details to be developed by the design team in isolation from the end users. This will then need to be confirmed and submitted for approval to the SAB prior to construction commencing on site.

Conclusion

8. FOUL DRAINAGE

The most sustainable method for the disposal of foul water discharge from the proposed development site is via the existing mains sewer network. The capacity of the sewer has been confirmed by DCWW for the proposed foul flows generated from the site a copy of the pre planning response from DCWW is included in Appendix D.

The new development will seek to discharge foul flows via gravity from the site to the public foul sewer located west of the site within Pilgrim's Way, the depth of the existing sewer should allow the whole development to discharge via gravity with no requirement for pumping.

The existing foul pumping station located near the eastern boundary of the site that currently serves dwellings from Maes Ffynnon is proposed to decommissioned and removed with the existing flows being diverted into the new gravity system, this option will need to be discussed further with DCWW at detailed design stage.

The capacity of the existing sewer to receive the flows from the proposed development has been confirmed by DCWW via a pre planning response (PPA0005824), a copy of the pre planning response from DCWW is included in Appendix D.

All on site sewerage systems will be designed and constructed to comply with building regulations requirements with any adopted elements in accordance with the latest edition of "Sewers for Adoption" and any of the adopting authority's (DCWW) specific requirements.

9. SURFACE WATER DRAINAGE

The aim of the surface water drainage strategy is to mimic the natural catchment processes as closely as possible and the proposed system will need to be designed in accordance with the statutory (SDSSW) document 2018 and any local authority's SAB requirements and CIRIA's C753 SuDS Manual as well as meeting the requirements of Building Regulations, Document H.

In determining a suitable methodology for disposal of surface water flows from this development, it is necessary to explore the technical options outlined under Standard S1 in the statutory (SDSSW) document 2018 published by the Welsh Government. Based on the hierarchy it is proposed to discharge surface water runoff from the development to the existing watercourse.

Surface water runoff is to be attenuated from area 1 and area 2 of the site to 2.9l/s and 15.9l/s respectively, the area 2 attenuated discharge rate is a combination of the proposed attenuated flows (7.1 l/s) and the existing flows (8.8 l/s) as described in section 7.2.3 on this report, this run-off rate will then be maintained for all rainfall events up to and including a 100YRP with 40% allowance for climate change and urban creep. Along with providing a minimum of 185cu of additional storage to compensate of the removal of the existing attenuation basin.

Given the proposed site layout storage could be provided in the form of rain gardens, areas of permeable paving, a cellular storage tank and attenuation basins. The main storage features for the site will be the attenuation ponds and a cellular storage tank, where the ponds will be located at the western part and northern part of the site and east and west of the existing watercourse respectively; and the cellular storage tank will be located within the centre of the site within phase 2 and southwest of the existing watercourse, with rain

gardens and permeable paving on each plot providing further storage upstream of the main feature. All drainage features will be developed further at detailed design stage.

As the scheme is a residential development it has been considered that the use of a grey water system would not be suitable due to there being periods of very low demand which may result in legionella issues however other basic forms of rainwater harvesting could be incorporated into the development in the form of rainwater butts that will collect water from rainwater downpipes and store it for irrigation of the soft landscaped areas and planting beds.

Amenity and biodiversity benefits to the site will be provided in the form of rain gardens which will be incorporated throughout the site and also form part of the attenuation storage for the site along with the main attenuation pond, these will maximise the available green infrastructure within the development site which will improve air quality and water quality of the site.

All on site surface water drainage systems will be designed and constructed to comply with the (SDSSW) and building regulations requirements. The detailed design of the scheme will incorporate the philosophies outline in this report regarding standards S1-S6 listed in section 7 of this report.

Refer to drawings in Appendix C for further details of the proposed layout and features to be used across the site.

Date: 30/06/2021
Our Ref: PPA0005824

Dear Miss Li,

**Site Address: Roch
Development: Residential**

I refer to your pre-planning enquiry received relating to the above site, seeking our views on the capacity of our network of assets and infrastructure to accommodate your proposed development. Having reviewed the details submitted I can provide the following comments which should be taken into account within any future planning application for the development.

SEWERAGE

Firstly, we note that the proposal relates to a development of 55 dwellings and acknowledge the is allocated (Ref: HSG/114/LDP-01) within the Local Development Plan (LDP). In reference to our representations during the LDP consultation process, namely the 'Statement of Common Ground', we can confirm that an assessment has been undertaken of the public sewerage system to accommodate 55 dwellings and informs our appraisal as follows.

Public Sewerage Network

The proposed development site is located in the immediate vicinity of a foul only sewerage system, which drains to Newgale Waste water Treatment Works (WwTW).

You are also advised that some public sewers and lateral drains may not be recorded on our maps of public sewers because they were originally privately owned and were transferred into public ownership by nature of the Water Industry (Schemes for Adoption of Private Sewers) Regulations 2011. The presence of such assets may affect the proposal. In order to assist you may contact Dwr Cymru Welsh Water on 0800 085 3968 to establish the location and status of the apparatus in and around your site.

glas
Glas Cymru Cyfyngedig

Welsh Water is owned by Glas Cymru – a 'not-for-profit' company.
Mae Dŵr Cymru yn eiddo i Glas Cymru – cwmni 'nid-er-elw'.

We welcome correspondence in
Welsh and English

Dŵr Cymru Cyf, a limited company registered in

Nelson, Treharris, Mid Glamorgan CF46 6LY

Rydym yn croesawu gohebiaeth yn y
Gymraeg neu yn Saesneg

Dŵr Cymru Cyf, cwmni cyfyngedig wedi'i gofrestru yng
Nghymru rhif 2366777. Swyddfa gofrestredig: Heol Pentwyn
Nelson, Tre Harris, Morgannwg Ganol CF46 6LY.

Please be mindful that under the Water Industry Act 1991 Dwr Cymru Welsh Water has rights of access to its apparatus at all times.

Surface Water Drainage

As of 7th January 2019, this proposed development is subject to Schedule 3 of the Flood and Water Management Act 2010. The development therefore requires approval of Sustainable Drainage Systems (SuDS) features, in accordance with the 'Statutory standards for sustainable drainage systems – designing, constructing, operating and maintaining surface water drainage systems'. As highlighted in these standards, the developer is required to explore and fully exhaust all surface water drainage options in accordance with a hierarchy which states that discharge to a combined sewer shall only be made as a last resort. Disposal should be made through the hierarchical approach, preferring infiltration and, where infiltration is not possible, disposal to a surface water drainage body in liaison with the Land Drainage Authority and/or Natural Resources Wales.

It is therefore recommended that the developer consult with Pembrokeshire County Council as the determining SuDS Approval Body (SAB), in relation to their proposals for SuDS features. Please note, DCWW is a statutory consultee to the SAB application process and will provide comments to any SuDS proposals by response to SAB consultation. Please refer to further detailed advice relating to surface water management included in our attached Advice & Guidance note.

In addition, please note that no highway or land drainage run-off will be permitted to discharge directly or indirectly into the public sewerage system.

Foul Water Drainage – Sewerage Network

We have considered the impact of foul flows generated by the proposed development and concluded that flows can be accommodated within the foul sewerage system. We advise that the flows should be connected to the foul sewer located in Pilgrims Way at manhole SM87213207.

Should a planning application be submitted for this development we will seek to control these points of communication via appropriate planning conditions and therefore recommend that any drainage layout or strategy submitted as part of your application takes this into account. However, should you wish for an alternative connection point to be considered please provide further information to us in the form of a drainage strategy, preferably in advance of a planning application being submitted.

You may need to apply to Dwr Cymru Welsh Water for any connection to the public sewer under Section 106 of the Water industry Act 1991. However, if the connection to the public sewer network is either via

a lateral drain (i.e. a drain which extends beyond the connecting property boundary) or via a new sewer (i.e. serves more than one property), it is now a mandatory requirement to first enter into a Section 104 Adoption Agreement (Water Industry Act 1991). The design of the sewers and lateral drains must also conform to the Welsh Ministers Standards for Foul Sewers and Lateral Drains and conform with the publication "Sewers for Adoption"- 7th Edition. Further information can be obtained via the Developer Services pages of www.dwrcymru.com.

SEWAGE TREATMENT

No problems are envisaged with the Waste Water Treatment Works for the treatment of domestic discharges from this site.

WATER SUPPLY

A water supply can be made available to service this proposed development. However, this would require the installation of off-site mains from our 6" diameter watermain located in Pilgrims Way. Under Sections 40 - 41 of the Water Industry Act 1991 the above cost is requisitionable and, subject to us receiving your detailed site layout plan and your programme for construction, we would be able to provide a more accurate assessment of the developer's contribution. These details should be sent to the above address.

I trust the above information is helpful and will assist you in forming water and drainage strategies that should accompany any future planning application. I also attach copies of our water and sewer extract plans for the area, and a copy of our Planning Guidance Note which provides further information on our approach to the planning process, making connections to our systems and ensuring any existing public assets or infrastructure located within new development sites are protected.

Please note that our response is based on the information provided in your enquiry and should the information change we reserve the right to make a new representation. Should you have any queries or wish to discuss any aspect of our response please do not hesitate to contact our dedicated team of planning officers, either on 0800 917 2652 or via email at developer.services@dwrcymru.com

Please quote our reference number in all communications and correspondence.

Yours faithfully,

Owain George
Planning Liaison Manager
Developer Services

KEY		SITE BOUNDARY					
General Notes:							
<p>. Drawing to be read in conjunction with all other relevant project drawings.</p> <p>. Use of this drawing does not absolve the client from his responsibilities under the Health and Safety: The Construction Design and Management Regulations 2015. The Principal Designer is required to contact Hydrock Consultants prior to permitting this drawing to be used in connection with any construction works.</p> <p>. The drawing shall be read in conjunction with the health and safety information provided and/or within the pre-construction information.</p> <p>. Before commencement of works associated with the drawing refer to all relevant health and safety information for the works including residual risk information.</p> <p>. The drawing has been based on information provided by other parties and Hydrock do not warrant the accuracy of this information.</p> <p>. The drawing indicates the design intent for the works and items/service routes in such detail as to indicate the design. The drawing does not show all components that may be necessary to locate services in a fully coordinated manner.</p> <p>. It is known that existing utility company underground services and apparatus is present within the proposed works area and it is the Contractors responsibility to locate existing services on site accurately.</p> <p>. The Contractor should comply with hs(q) 47 "Avoiding Danger from Underground Services" when excavating around existing services.</p> <p>. The Contractor is to verify the line, level and diameter of existing sewers before commencing drainage works.</p> <p>. The contractor should allow for all necessary investigative work (cat detection, trial holes, etc.) to determine route and depth of all underground services to avoid damage and preserve supplies to existing users.</p> <p>1. The drawing shall be used for the intended purpose only and Hydrock does not warrant the accuracy of this information.</p> <p>2. Dimensions shall not be scaled from the drawing and the contractor shall be responsible for obtaining all dimensions and level's on site for the actual setting out of the works.</p> <p>3. Hydrock is not responsible for checking dimensions on site.</p> <p>4. Hydrock is not responsible for setting out grid lines, building line etc</p> <p>5. Hydrock is not responsible for dimensions used in the ordering and manufacturing of equipment and this shall be the responsibility of the contractor.</p> <p>6. All figured levels are in metres and related to existing survey grid & datum unless noted otherwise</p> <p>7. All figured dimensions are in metres unless noted otherwise.</p>
